

**EFFICIENT PROCESSING OF EXTENSIBLE MARKUP  
LANGUAGE DOCUMENTS IN CONTENT BASED ROUTING NETWORKS**

5

**ABSTRACT OF THE DISCLOSURE**

10 A method, system, and computer program product for efficient processing of  
Extensible Markup Language (XML) documents in Content Based Routing ("CBR")  
networks. Specifically, the method involves converting existing XML documents to a  
machine-oriented notation ("mXML") which is significantly more compact than XML, while  
still conveying the content and semantics of the data and the structure of the document.  
15 Documents are converted from XML to mXML upon entering a CBR subnetwork and/or  
upon receipt by an mXML-capable device. The documents are then processed in mXML  
format. Devices within the inventive system are provided with an awareness of whether  
target devices or processes are mXML-capable. Documents being routed to a target which is  
mXML-capable are passed in mXML format while documents being routed to a target which  
is not mXML-capable are converted to XML before they are passed.
